

Yesterday's approval. Today's evidence.

A four-week shadow pilot for drone inspection operators

An internal mission approval depends on facts that can change. GroundProof links jobs to source snapshots and requires a fresh decision after evidence changes. Expired or unavailable evidence prevents signoff.

THE WORKFLOW

Capture a public source or record an operator-supplied excerpt and reference. A person reviews its exact content. Signoff checks the mission revision and evidence hashes. Changes identify affected jobs and invalidate old approvals. Capture history and export preserve retained evidence.

WHAT THE PILOT TESTS

Can a coordinator reduce total review effort, including maintaining private records and handling alerts? The pilot runs alongside the operator's existing process. Operators retain original permission documents and make all flight decisions.

Week	Work and evidence
1	Map 5-10 recurring sites. Agree required sources and freshness limits. Record manual review time.
2	Run GroundProof in shadow mode. Compare review effort, source coverage, and discrepancies.
3	Run controlled source-change, expiry, outage, and stale-approval drills in a separate test workspace.
4	Review measured benefit and operating cost. Make a paid continuation, revise, or stop decision.

Proposed scope: 10-20 source records and at least 30 job reviews if workload permits. This is a feasibility target, not a statistically powered study. No operator is currently committed.

A measurable continuation decision

Agree the thresholds before the pilot. Report every numerator, denominator, exception, and source gap.

Measure	Proposed acceptance threshold
Approval control	Zero accepted invalid approvals in the defined failure drills.
Source coverage	At least 90% of the agreed required sources, with uncovered requirements explicitly handled.
Review effort	At least 25% lower median active review time on comparable jobs, with no increase in unresolved evidence.
Useful alerts	At least 80% of reviewed alerts represent changes the operator considers actionable.
Continuation	A named budget owner agrees to a defined paid next step after seeing the results.

COMMERCIAL HYPOTHESIS

Proposed price: **\$199 per workspace per month**. The current product and initial pilot use one coordinator account. Shared team roles remain future work. Illustrative time value is \$267/month at 100 jobs, four minutes saved per job, and \$40/hour. At 50 jobs it is \$133, below the price. The pilot must establish the actual inputs and value.

ENTRY CONTROLS AND STOP CONDITIONS

Save the account recovery key and test password rotation. Verify TLS, access controls and backup restore before loading data. Agree source access and retention. Export needed capture history before source deletion. Stop for an approval bypass or data-access defect. Keep the established operational process.

THE ASK

One inspection operator, a coordinator for short weekly reviews, an experienced remote pilot or operations reviewer, and representative recurring jobs. GroundProof supplies the shadow workspace, failure drills, and a written outcome report.

Current evidence: working software with saved-key recovery, capture history, authenticated Anakin retrieval and labeled simulations. No customer traction, flight validation, certification, or measured commercial savings claimed. AI-assisted development and research.
